

Dolphins, Exploring Their Sound

How much do we know?

- We are in diapers
- A Quote from John C. Lily

“They reach toward those of us who are willing to reach toward them. It may be that some day not too far distant we both can draw to an end the 'long loneliness,' as Loren Eiseley called it.”

Lets remember these people

- Dr. John C. Lily

Dolphins into the Future

So Different, yet so Alike

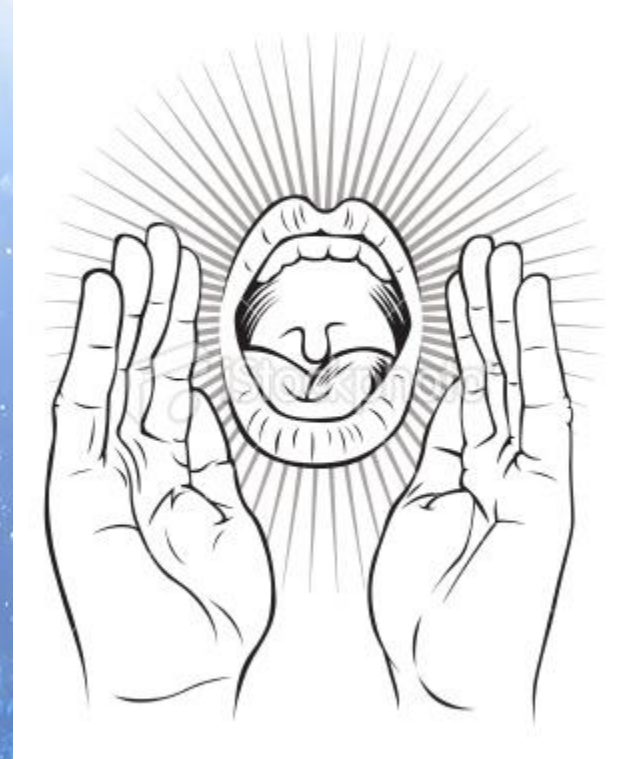

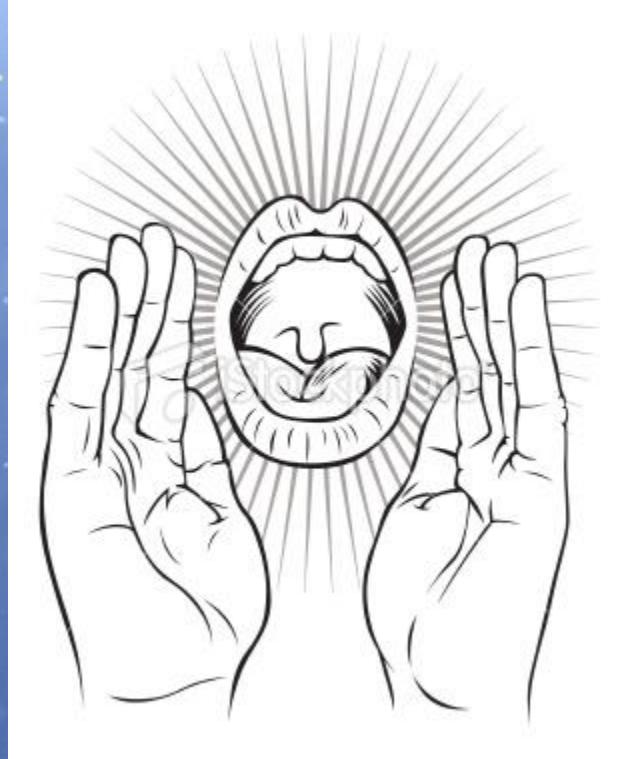

- Dolphins naturally produce an ultrasonic frequency that is four - times the frequency used for therapeutic purposes in clinics and hospitals throughout the United States.

- It is important to remember that the dolphin ultrasound is delivered through water, a highly efficient medium for sound transference – 60 times more efficient than air.

Over Toning

- They have two vocal organs!
- There is a right phonation apparatus and a left phonation apparatus, each one in its half of the nose.
- The dolphins can not only produce sounds on each side, separately and independently, but they can intermix two sets of sounds, sequentially and simultaneously.

- Dolphins also communicate using Acoustic Imagery!
- They make sounds and turn them into pictures, shapes, and colors.

How many?

Tricks

- Stereo Communication:
Two dolphins communicating sounds like three.
- * They use their laryngeal tight sonar beam to communicate when they don't want anybody else to listen to their conversation.
- *This was noticed by Dr John Lilly while doing lab research.
- They have the ability to stop time by emitting an either high or low sound frequency resulting in a telepathic wave. This in turn makes them able to shift dimensions and alter our perceptions and levels of consciousness.
- They can “heal” or rather bring their bodies and that of others back into balance.

How do they Heal?

- They are known for their scanning abilities.
- They can scan someone's body as a tool to balance the energies.
- They send their tones into the water affecting ones metabolism, regulating heart rates, nervous system, nutrient absorption and many other bodily systems. Could this mean that they are knowledgeable enough to find ones individual key note?

**This all documented on Joan Oceans book.*

Swimming with dolphins ends boy's years of silence

By Sean O'Neill

AN eight-year-old boy has spoken his first words after swimming with dolphins at a therapeutic centre in Miami.

Nikki Brice suffered oxygen deprivation and minor brain damage at birth and never developed the power of speech.

His family viewed the trip to the Human Dolphin Therapy Centre in Florida as their last chance.

They raised £10,500 through charitable events which were supported by, among others, the Spice Girls and Jane Asher. A friend donated his £7,000 savings to their appeal.

Earlier this week, after three days of intensive therapy mixed with sessions in the dolphin pool, Nikki uttered his first word.

Called out of the pool at the end of the swimming period, he stood disconsolate at the water's edge, pointed at the dolphins and said: "In."

Since then, he has been encouraged to exercise his vocal chords and has just about mastered "please" and "duck" and is close to saying other simple words.

His mother, Tabitha, said: "At first Nikki was a bit scared of the dolphins. On the second day he began to touch them and on the third day he was swimming with them."

"We hadn't been here for long when Nikki was told to get out of the water at the end of a dolphin session and he stood very quietly at the edge of the tank."

"He must have thought he was not going to be allowed to go swimming with the dolphins again because he suddenly pointed at the water and said 'In'."

"He was telling us he wanted to get back in to the water. We just stood there in shock because it was so unexpected. But once

Magic moments: Nikki uttered his first words after three sessions in the dolphin pool

we got over it we quickly told him he could go in again and he soon cheered up.

"I have hoped for years to hear Nikki speak and I am really chuffed to bits with what has happened."

The centre's therapy regime, interspersed with 40-minute swimming sessions, claims a 97 per cent success rate in treating children with conditions similar to Nikki's.

Dr David Nathanson, who is supervising his three-week treatment, said: "He is doing very well and we are delighted that he has spoken for the first time."

"I am looking to build on this to encourage him to extend his

vocabulary and enhance his speech. He is a lovely child and very enthusiastic. Obviously it is early days and a great deal needs to be done yet, but Nikki has broken out of his world of silence."

The centre provides treatment for up to eight children at a time with different problems.

The dolphin sessions are an essential part of its programme offering therapeutic and motivational elements. But no explanation has ever been given for the success of such therapies.

Mrs Brice, from Weston-super-Mare, Somerset, said Nikki quickly overcame his initial fears and now loved swimming with the

dolphins. "He cannot wait to get in, even though the water is cool in the mornings," she said.

"We just heard stories about children getting better before, now we are actually seeing it happen before our eyes. We are already seeing his behaviour getting better and watching other children improve day by day."

"It is like seeing magic happening before your eyes, more so because no one can explain all these wonderful things that are happening."

"There is just something magical that happens between children and dolphins, something that I don't think we will ever fully understand."

Nikki Brice: overcame initial fears and is now making progress
