

Voice attraction Woman VS Man By: Itai Argaman

One of the main things that separate us one from each other is our voice,
You can close your eyes and recognize someone by his/her voice.
You can easily tell if the voice you hear is a female or male's voice,

The main difference between male and female voice is the sizes of the vocal fold,
Adult male voice is usually lower-pitched and has larger folds. The male vocal
folds are between 17 mm and 25 mm in length.

The female vocal folds are between 12.5 mm and 17.5 mm in length.

However, You can take woman and man with the same sizes of Vocal cords but
their voice will sound totally different.

Studies have found that the lower the pitch of a man's voice, the higher his
testosterone level, which itself is an indicator of his genetic quality and sexual
fitness. Time and time again, studies find that women tend to find men with
lower-pitched or deeper voices more attractive.

So as we can see, the voice pitch is not just a physical thing, the hormones and
testosterone are also responsible for the way the voice is sounds like and the
way we attracted to someone.

Man who's change his gender will take hormones to shift his physical body as
well as his voice, there are also Voice technics that can transform the Voice pitch
to sounds like a woman eventually and still the size of the vocal folds remain the
same.

2009 study of the Hazda tribe in Tanzania found that men with lower pitch
tended to have more children.

Now, a new study published in the journal Memory & Cognition reports that
women even remember information better when a lower-pitched male voice
tells it to them than when a higher-pitched male voice does. No such difference
exists in their memory of words spoken by low- and high-pitched female voices.
"We were able to show that women's memory is in fact sensitive to masculinity
cues in men's voice pitch," psychologist Kevin Allan of the University of
Aberdeen and his colleagues wrote. First, this shows that memory is attuned to
sexually dimorphic cues. Second, it supports the hypothesis that our memory
intervenes to help us screen mates, in order to enhance our chances of producing
healthy offspring.

According to experiments conducted by David Puts, an anthropologist at
Michigan State University, men with deeper voices may have more luck in
attracting members of the opposite sex. Testosterone, the hormone that
elongates the vocal cords during puberty, is also responsible for other manly
features — such as broad shoulders and hairy faces. And as indicators of sexual
maturity, these traits may play a large role in the process of finding a mate for

reproduction. This means that since the beginning of humankind, a man's voice could have functioned as a testosterone advertisement.

In the other side high-pitched female voices females were found to be attractive because they indicated the speaker had a small body and a younger age

Is there another reason that we attract specifically to someone?

The Voice is an energetic projection of the body/mind and is able to give us a snapshot of its balance and harmony at any given moment in time.

In my opinion, the attraction between man and woman will happen when there's a potential balance between our frequencies and the other side frequencies,

We are always looking for balance in order to be in peace, and in order to have perfect and healthy relationships; we will look for a partner that has frequencies that we need in order to be in balance.

It means that if our voice, has a great amount of energy in a specific range of frequencies like the range of the notes C-E but we have less energy in the range of the notes F-G, we will attract someone that has a large amount of energy in the range of F-G or Low amount of energy at the range of C-E.

We can also reject someone if he/she has the same or stronger amount of energies in the same range of our energies, that kind of relationship often creates stress and unbalance since it creates a resonant frequency that boost the energy that we already have enough of and we don't need it from an external source.

Our voice is a great tool to analyze our health situation by its frequencies, it can be a range of frequencies to get a bigger perspective but it can be notch or peak in a specific frequency so as much as we listen to the other side's voice, we can get a better and accurate details about the potential of this relationship, our voice print is a picture of our body, mind and emotions.

We intuitively testing the voice that we hear, first, to see if it has a frequency that is beneficial to us and the second thing is we hear how we can help to the other side by giving him/her the energy she needs in order to grow together and to resonate with us.

Another aspect is that the Woman voice is usually one octave above the men's voice, when you mix both voices together you will get a perfect frequency range from low to hi Same as in nature, in the forest you hear a full range of frequencies from low to the high; it means that there is a perfect balance of frequencies. Generally A man with his lower voice is more grounded and connected to the ground (Hunting, bringing food, build the house...) and woman with higher voice is much more spiritual and connected to her emotions and feeling as well as to higher wisdom. Together they create a perfect balance of Oneness.

Conclusion: Never judge a book by its cover.
